

FARM FLOOD HEALTH THREATS

RISK FACTORS DURING RECOVERY

Free Webinar

Date: Wednesday, August 30, 2017

Time: 12:00pm - 1:15pm CDT

(limited space of 200 attendees)

Floods can heighten the risk of health threats such as mold, tetanus bacteria, contaminated well water, heat illness and high stress. This is especially true on farms and ranches where inherent farm hazards such as machinery and equipment, livestock, and agriculture chemicals are displaced and co-mingle, putting all emergency response personnel, farm workers and family members in danger.

This presentation will highlight basic precautions to prevent possible diseases and injuries during and after flooding.
